

# Warning Signs

We **ALL** have to pay attention to **WARNING SIGNS** when they occur.

Examples of warning signs that each of us has experienced:

- Lunch tents, office settings, hallway and/or break room discussions about unsafe situations
- Situations that just don't "look right/feel right" as we walk through our job site
- Strange noises/odors within the work area, an increase in active process unit alarms when the plant appears to be operating normally
- Visual smoke from a distance
- A possible steam/process leak that surfaces and makes noise in your work area while you are working
- A disgruntled individual acting out of his/her normal demeanor
- An individual that blurts out "do not worry about safety procedures I've done this task 1000 times and nothing went wrong"
- If your H2S monitor alarm sounds
- If there is a "do not operate" tag on a machine
- All danger and caution tags
- If a sign indicates "wet paint" guess what the paint is wet – DO NOT TOUCH!
- High voltage
- Warning lights
- And last but not least "DANGER DO NOT ENTER"

Pay attention to the warning signs. **STOP, QUESTION and CONVINCING YOURSELF** that all is well before proceeding on with your day.

**Escalate unsafe conditions or behaviors when necessary**
